What are the pioneers of agentic engineering doing right now?

We ask them. This is the Agentic Agency Practitioner Series — unfiltered conversations with the people building in production.

Prayson Wilfred Daniel
Principal Data Scientist · Norlys
DENMARK'S LARGEST ENERGY COMPANY · TEAM _42

"Solve the problem."

Theology. Philosophy. Data science.

He didn't start with code. He started with the question of free will — and modelled it with Bayesian probability. The bridge to data science was shorter than it looks.

The Seal Team model.

- Operates outside Norlys' standard SAFe quarterly cadence—mandate from the top
- Infrastructure, security, and data pre-secured before any problem is scoped
- Problem owner is "the alpha and the omega" — single source of truth
- Cross-domain: data science, engineering, domain experts — in the same room

Idea → production in under 5 days. 5 projects in 3 weeks.

"People do not always know what they they actually do.

His customer service project :stated requirements and user story contradicted by actual logs on what agents said and how they said in real - and highly rated - customer converations.
He trawled the logs with LLMs.The data told a different story.He leads with dialogue, trusts the data.

Every LLM wears mascara.

The physicist-and-parrot: what we've built is capability,not intelligence. Guardrails give the appearance of ethical reasoning — but they can be mathematically circumvented.

> "LLMs like ChatGPT and Claude are not intelligence. Keep your critical thinking"

THIS ISN'T A LAB. THIS IS PRODUCTION.

Norlys serves 1 million Danish homes and businesses.

Prayson's team is not running pilots. They're shipping agent-based systems into live infrastructure, with full organisational backing and pre-cleared capacity across engineering, security, and data.

> Team _42 · Norlys
> 15 people. Cross-domain. Liscence from the top. Operating outside standard SAFe cadence.

The eureka moments have plateaued.

LLM capability gains of the last two years have levelled off.No new eureka moments are likely soon. The models are good enough. The bottleneck isn't intelligence — it's context.

"Ask for forgiveness, not permission."

Your boss won't let you use the tools? Download an open-source alternative. On your own time. Become a practitioner on your own terms. Learn, experiment, and importantly, deliver value.

> Numbers and results can't be argued like an opinion. Earn your trust.
> Then scale the impact with the backing of your organization.

"Do not stop due to imperfect conditions.
Solve the problem.

Prayson Wilfred Daniel

Principal Data Scientist · Norlys

TEAM _42 · DENMARK'S LARGEST ENERGY COMPANY

Speaking · Data Innovation Summit · Stockholm, May 2026
